My cases shows a list of cases that are assigned to you, or your group.

Clicking on view referrals brings up a list of referrals for that particular case.

Each referral has a type and a state. Different behaviors can be associated with different types. For example, when a CLINICAL REFERRAL for a procedure is created, it may have a procedure, a deadline, a list of possible providers., etc.

Each referral contains one or more actions.

Each action has a type and a state. Different benaviors can be associated with different types.

State changes can trigger events, such as register a "transaction," send a "reminder message", create a "patient note" or change the state of a referral.

A user would be able to change the states of the actions from the My Cases user interface as the actions are completed.
